# CEMS & Process Gas Monitoring

The diagram illustrates the integrated process of cement manufacturing and air pollution control. Key components and flows include:

- Raw Material Processing:** Coal is processed in a Coal Mill and dedusted. Air is cooled in a Cooler Dedusting unit. The resulting clinker is cooled in a Clinker Cooler.
- Rotary Kiln:** The main heating unit where raw meal is processed. It receives air from the cooler and exhausts gas to the SNCR unit.
- Air Pollution Control:**
  - SNCR (Selective Non-Catalytic Reduction):** Reduces NO<sub>x</sub> emissions using ammonia water/urea.
  - SCR (Selective Catalytic Reduction):** Further reduces NO<sub>x</sub> emissions using ammonia water/urea.
  - Electrostatic Precipitator (ESP):** Removes particulate matter (PM) from the exhaust gas.
- Raw Meal and Conditioning:** Raw meal is stored in a silo and then conditioned in a conditioning tower before being ground in a raw mill.
- Final Product:** The final product is a duct containing H<sub>2</sub>O, O<sub>2</sub>, T, and p.

**Legend:**

- Blue arrow: Air
- Green arrow: Exhaust gas
- Brown arrow: Material
- Black arrow: Fuel
- Orange arrow: Ammonia water/urea

# Solutions & Field Installations

CEMS

### › Measuring components

- Depending on local regulations (CEMS)!
- Affected by fuels/materials used, prod. capacity, thermal power, exceptional permissions
- Gases measured: CO, NO, NO<sub>2</sub>, SO<sub>2</sub>, HCl, NH<sub>3</sub>, CO<sub>2</sub>, VOC, H<sub>2</sub>O, HF, Hg, O<sub>2</sub>
- In addition:
  - Dust concentration (particulate matter)
  - Gas velocity (flow)
  - Temperature & Pressure
  - Data Acquisition System used (sometimes direct data transfer to local authorities)

# Solutions & Field Installations

## CEMS - Extractive

### > Extractive technology - differentiation **Hot/Wet** & **Cold/Dry**

Extractive Technology **Hot Wet**

Extractive Technology **Cold Dry**

- Both technologies are offered by SICK
- Technology depending on main fuel & gas components to be measured

# Solutions & Field Installations

## CEMS - Extractive

### › Extractive **Hot/Wet** Measurement (Overview)

- Independent from sampling point
- High sample gas temperatures (185-220°C)
- Easy maintenance and validation
- Uninterrupted heating from the sampling probe to the sample gas cell
  - No cold intersections between the modules
  - No water condensation
  - Accurate and interference-free measurement results for water-soluble components such as HCl, NH<sub>3</sub>, HF ...

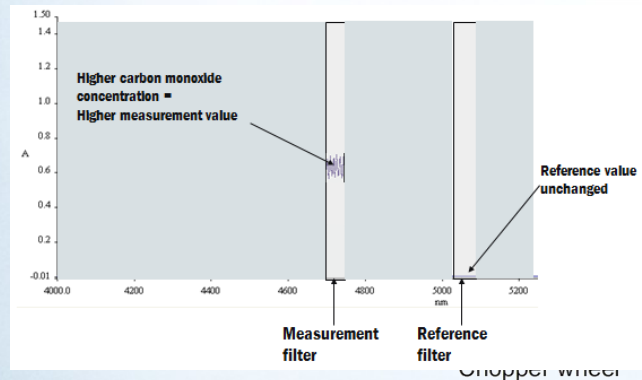

# Solutions & Field Installations

## CEMS - Extractive

### ➤ MCS200HW – multi component analyzer

- Measurement of up to 10 infra red- active gas compounds + O<sub>2</sub> & VOC
- Single beam photometer:
  - Gas-filter-correlation (GFC)
  - Interference-filter-correlation (IFC)

# Solutions & Field Installations

## CEMS - Extractive

### > MCS200HW – multi component analyzer

- Measurement of up to 10 infra red- active gas compounds + O<sub>2</sub> & VOC
- Heated sample probe and sample line extract flue gas (above dew point)
- Test gas supply at the gas sampling probe or at the analyzer
- Back-purging of gas sampling probe for cleaning of filters
- Fast sample gas exchange for minimizing adsorption and desorption effects
- Automated sample point switching
- QAL3 drift test according to EN 14181 with internal calibration filter wheel – no test gas required

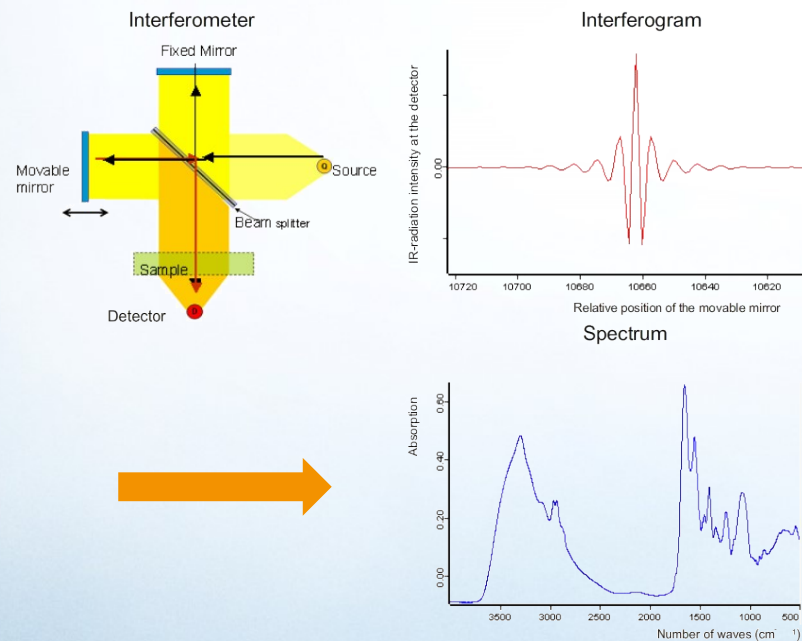

# Solutions & Field Installations

## CEMS - Extractive

### › MCS100 FT - multi component analyzer

- Measurement of more than 12 measuring components simultaneously
- Infrared spectroscopy according to the Fourier transformation (FTIR) principle ensures high measurement accuracy

# Solutions & Field Installations

## CEMS - Extractive

### > MCS100 FT - multi component analyzer

- Measurement of more than 12 measuring components simultaneously
- Infrared spectroscopy according to the Fourier transformation (FTIR) principle ensures high measurement accuracy
- Lowest approved measuring range for HF
- Remote control and diagnosis via software SOPAS ET
- Automatic adjustment of analyzer
- Automatic back flushing and filter cleaning of sampling unit
- Sample gas transport by an ejector without moving parts
- Operation via touchscreen

### **MCS200HW**

- Less complex technology
- Need of additional instrument to measure more components
- No need for high qualified personal for adjustment & regular maintenance

### **MCS100 FT**

- Requires more calibration effort (chemometric modelling)
- Can detect more components e.g. HF
- Simplified upgrade on side for additional components
- Less maintenance (ejector pump)

- Both technologies...
  - ...offer drift control w/o span gas use for QAL-3 function
  - ...can be equipped with remote control via ethernet for diagnosis & operation
  - ...can be upgraded with system integrated O<sub>2</sub> & FID measurement

# Solutions & Field Installations

## CEMS - Extractive

- › Mercury & its organic compounds are extremely toxic & can cause health problems
- › Mercury can enter food chain (esp. fish & shellfish)
- › Cement industry → appr. **10%** of all anthropogenic Hg emissions (190 t/y)  
→ worldwide average emission factor = **35mg/t<sub>cement</sub>**

Source: wbcasd

Source: Streets (2011)

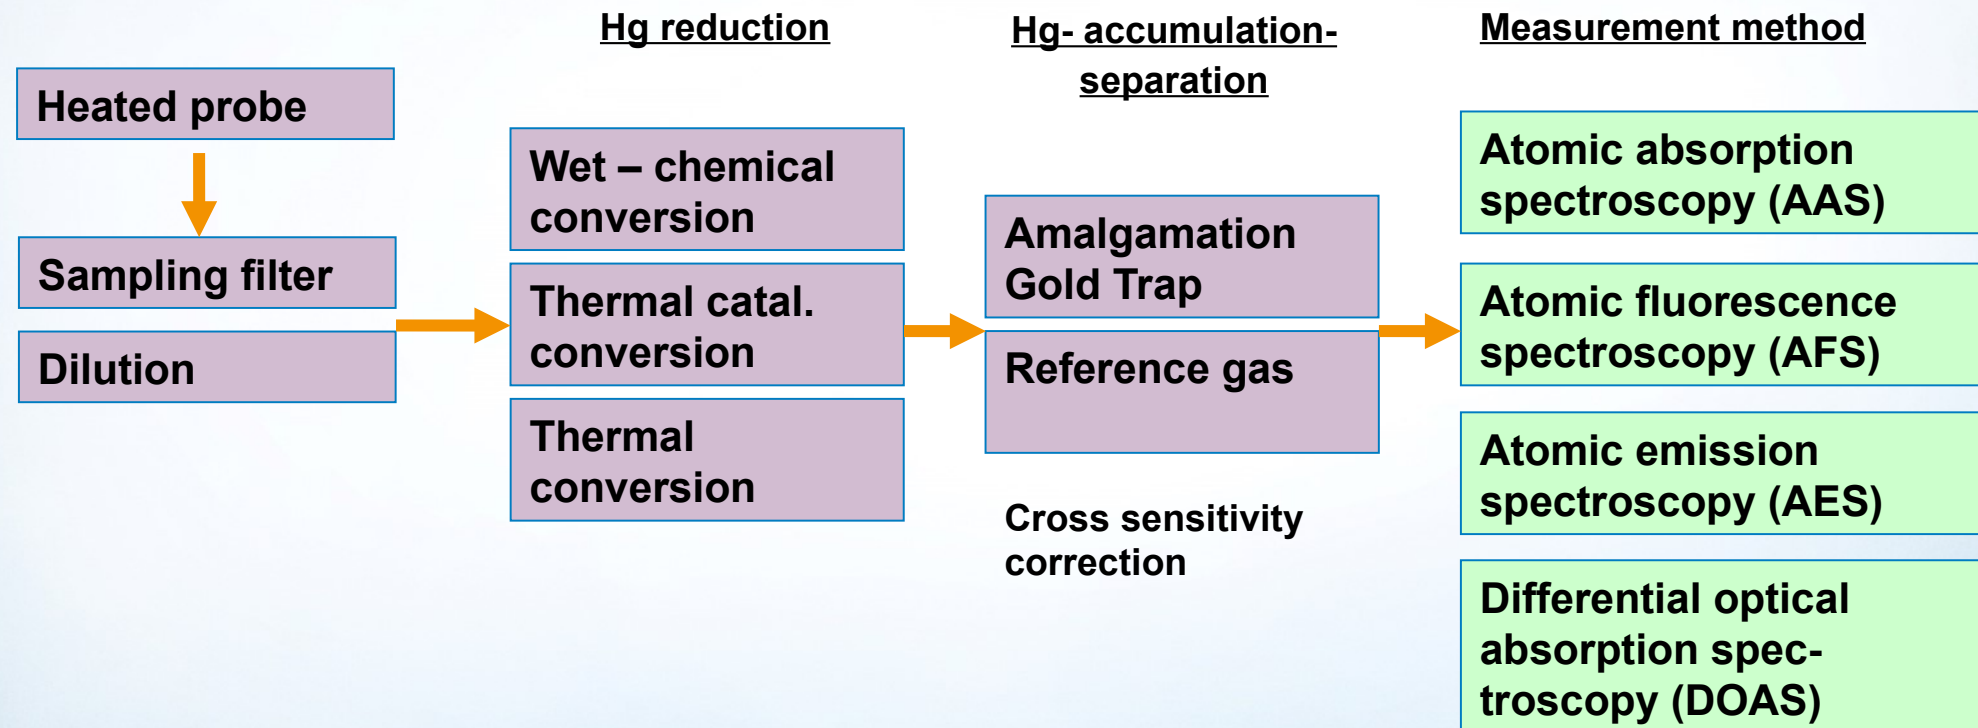

### Mercury emissions – compound & direct operation

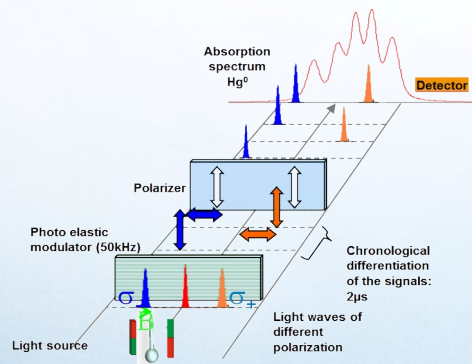

### > Available continuous mercury emission monitoring systems

### › Optimized approach (SICK technology)

# Solutions & Field Installations

## CEMS - Extractive

### > Patented direct measurement

- Zeeman atomic absorption spectroscopy within high temperature cell

### > Advantages

- No moving parts
- No Hg recombination
- No memory effects
- Continuous monitoring of total Hg
- Best possible cross sensitivity correction

### > Benefits

- Reliable measuring results at any time for all target industries: waste incinerators, power plants and cement plants!
- One system setup for emission and process gas monitoring

### › **MERCEM300z – Mercury gas analyzer**

- Continuous mercury emission monitoring of total mercury (Hgtot) in flue gases
- Approved measuring ranges:  
0-10/45/100/1000  $\mu\text{g}/\text{m}^3$
- One system setup for emission and raw gas monitoring (same parts, same instruction, same knowledge)
- Direct measurement: Combined advantages of high temperature conversion and Zeemann cross sensitivity correction
- Less operational costs: Automated check without need for test gases (Integrated adjustment cell)
- Maintenance interval of 6 months
- Longest certified measuring gas line of 35m
- Sample point switching possible

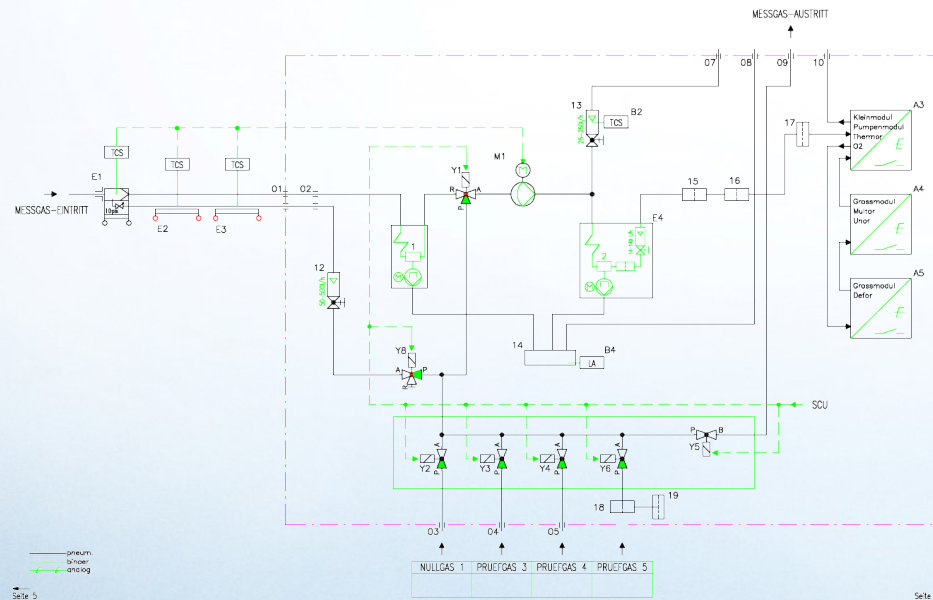

# Solutions & Field Installations

## CEMS - Extractive

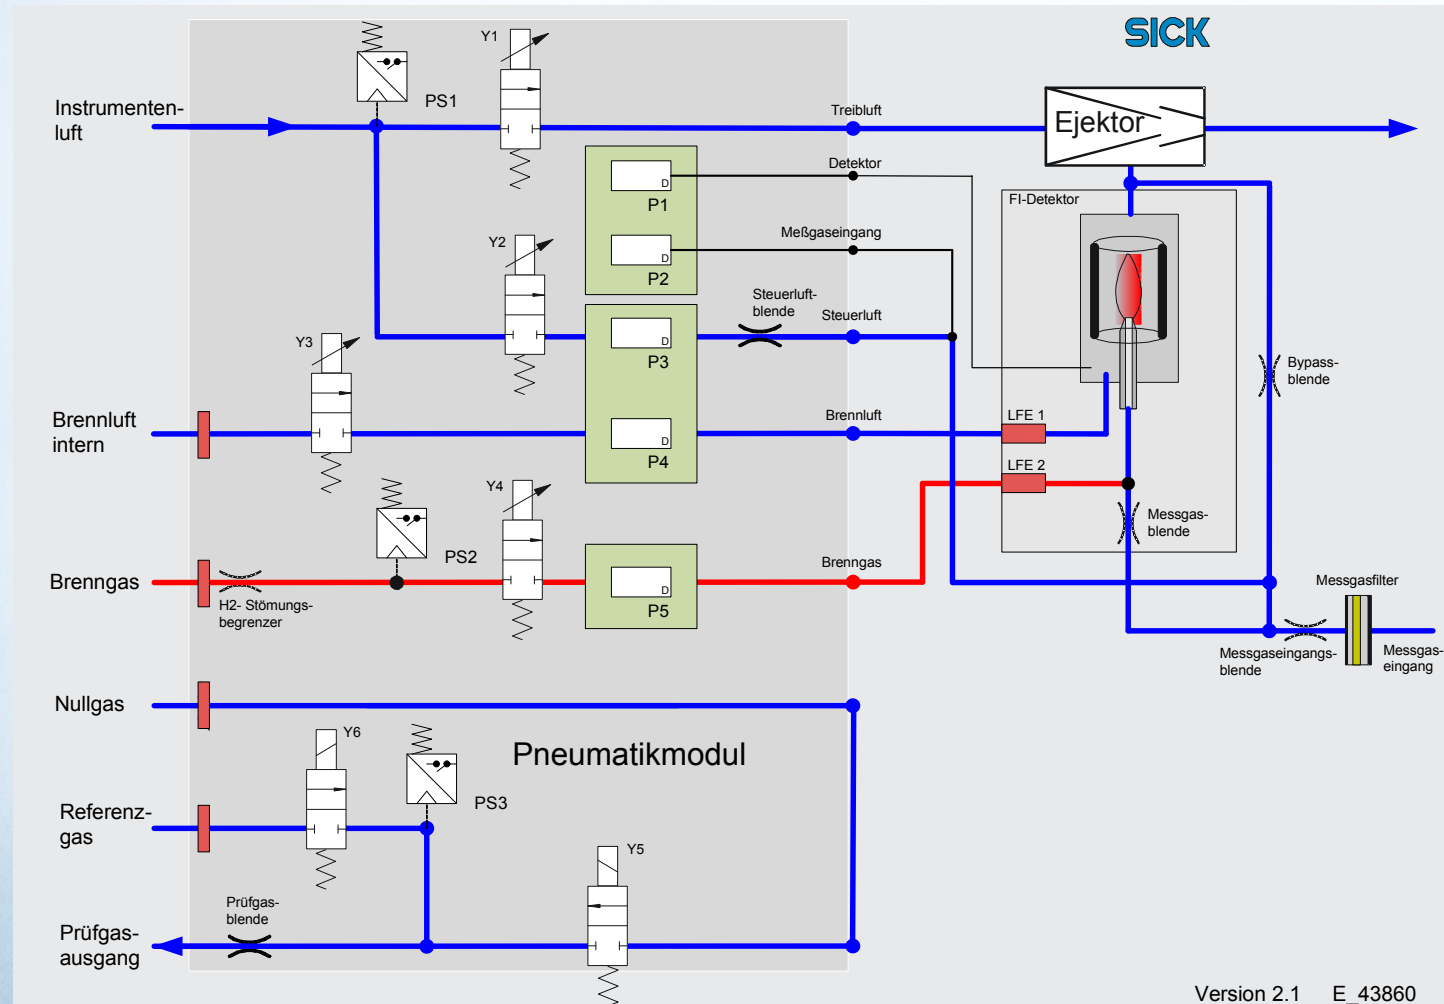

### › PowerCEMS100 (Cold Dry)

- Configurable setup
- Up to three analyzers
  - Three analyzers GMS811 or
  - Two GMS811 + combined with DAE or NOx-Converter
  - One GMS811 + DAE + NOx-Converter

### › Flame Ionization Detector → VOC/THC\* monitoring

Version 2.1 E\_43860

GMS810-FIDOR

\*

VOC = volatile organic carbons

THC = total hydro carbons

# Solutions & Field Installations

CEMS – In-Situ

## > In-situ technology

- no change of the gas composition  
(no extraction, no gas conditioning)
- fast reaction and measurement times
- direct reflection of operating conditions
- representative
- low maintenance
- extensive analyzer self-tests
- test gas –free operation
- Low installation effort  
(cabinet, air conditioning,..)

# Solutions & Field Installations

## CEMS – In-Situ

### > In-situ technology

- no change of the gas composition (no extraction, no gas conditioning)
- fast reaction and measurement times
- direct reflection of operating conditions
- representative
- low maintenance
- extensive analyzer self-tests

### > Dust measurement – Emission Monitoring

# Solutions & Field Installations

## CEMS – Dust

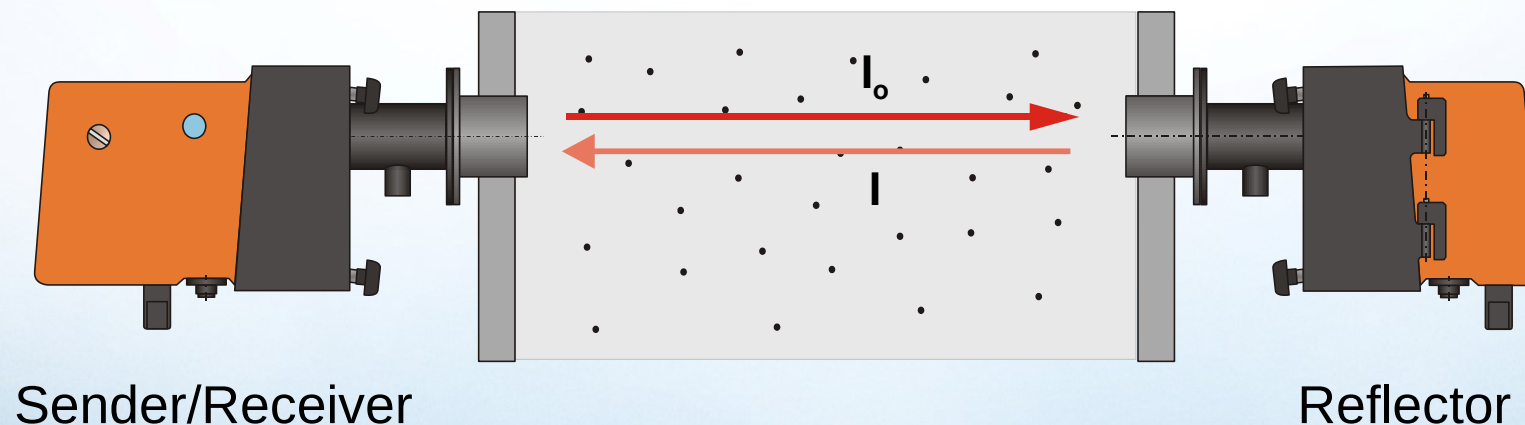

- › **Continuous** dust measuring technologies
  - Transmission
  - Scattered light
- › **Tribo-Electric**
- › **Semi-continuous** dust measuring technologies
  - **Beta-Radiation**
- › **Discontinuous** dust measuring technologies
  - Gravimetric measurement
- › For CEMS according to local regulation
- › Bag filter/electrostatic precipitator efficiency meas.

### › Transmission principle

- Measuring of the amount of light received as a fraction of the amount of light emitted in an optical cross stack monitoring.
- Opacity is the %-age of light lost
- Transmission is the %-age of light received
- Calculation of the dust concentration (for high dust concentrations)
- In-situ measurement

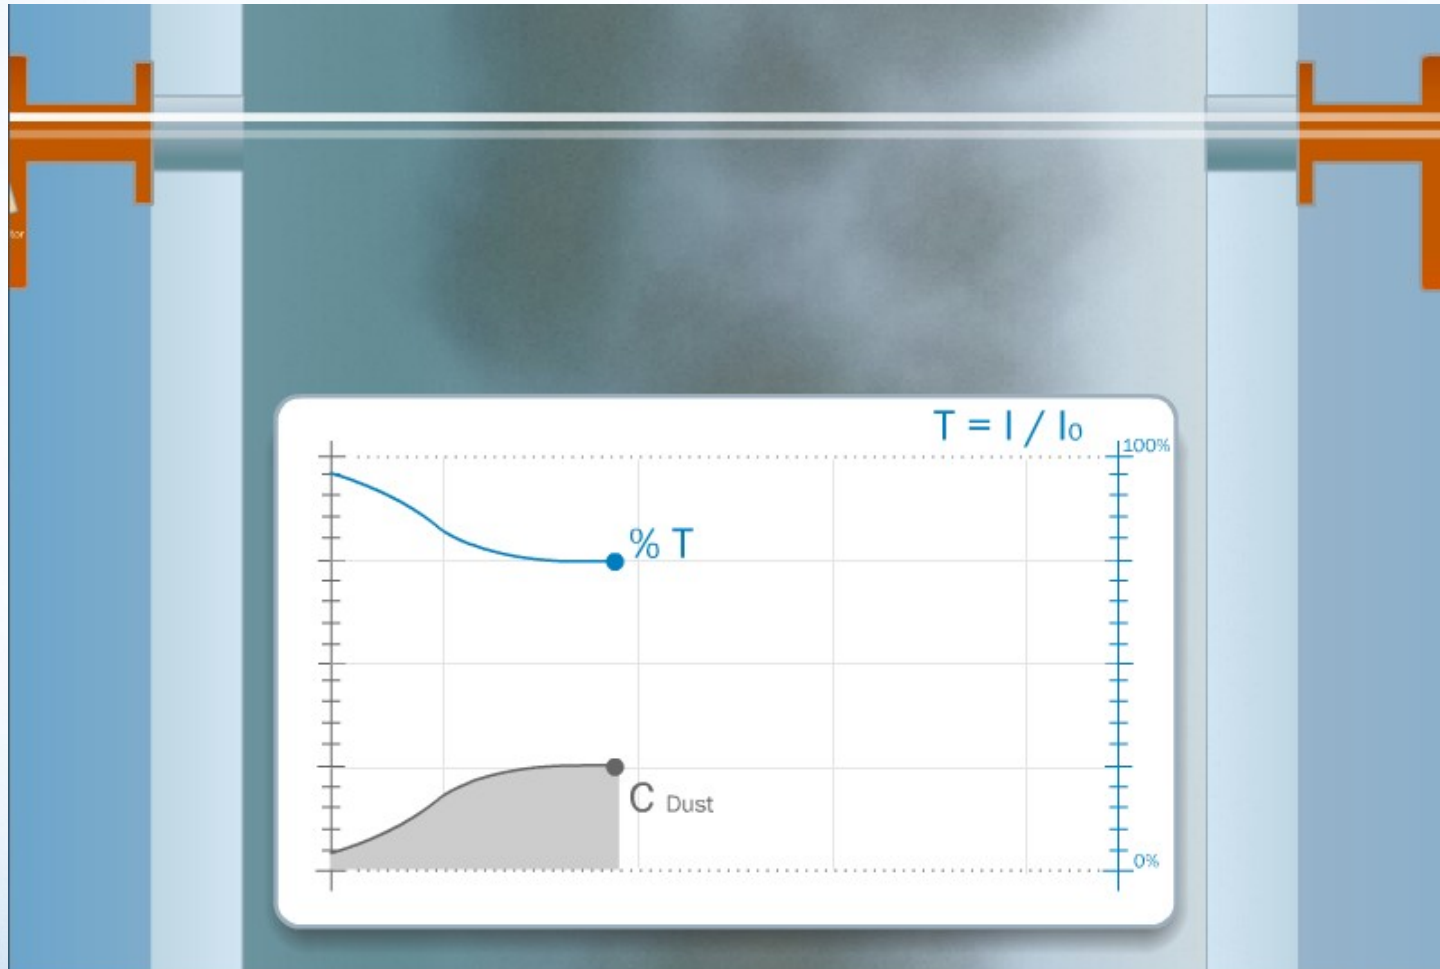

### > Transmission principle

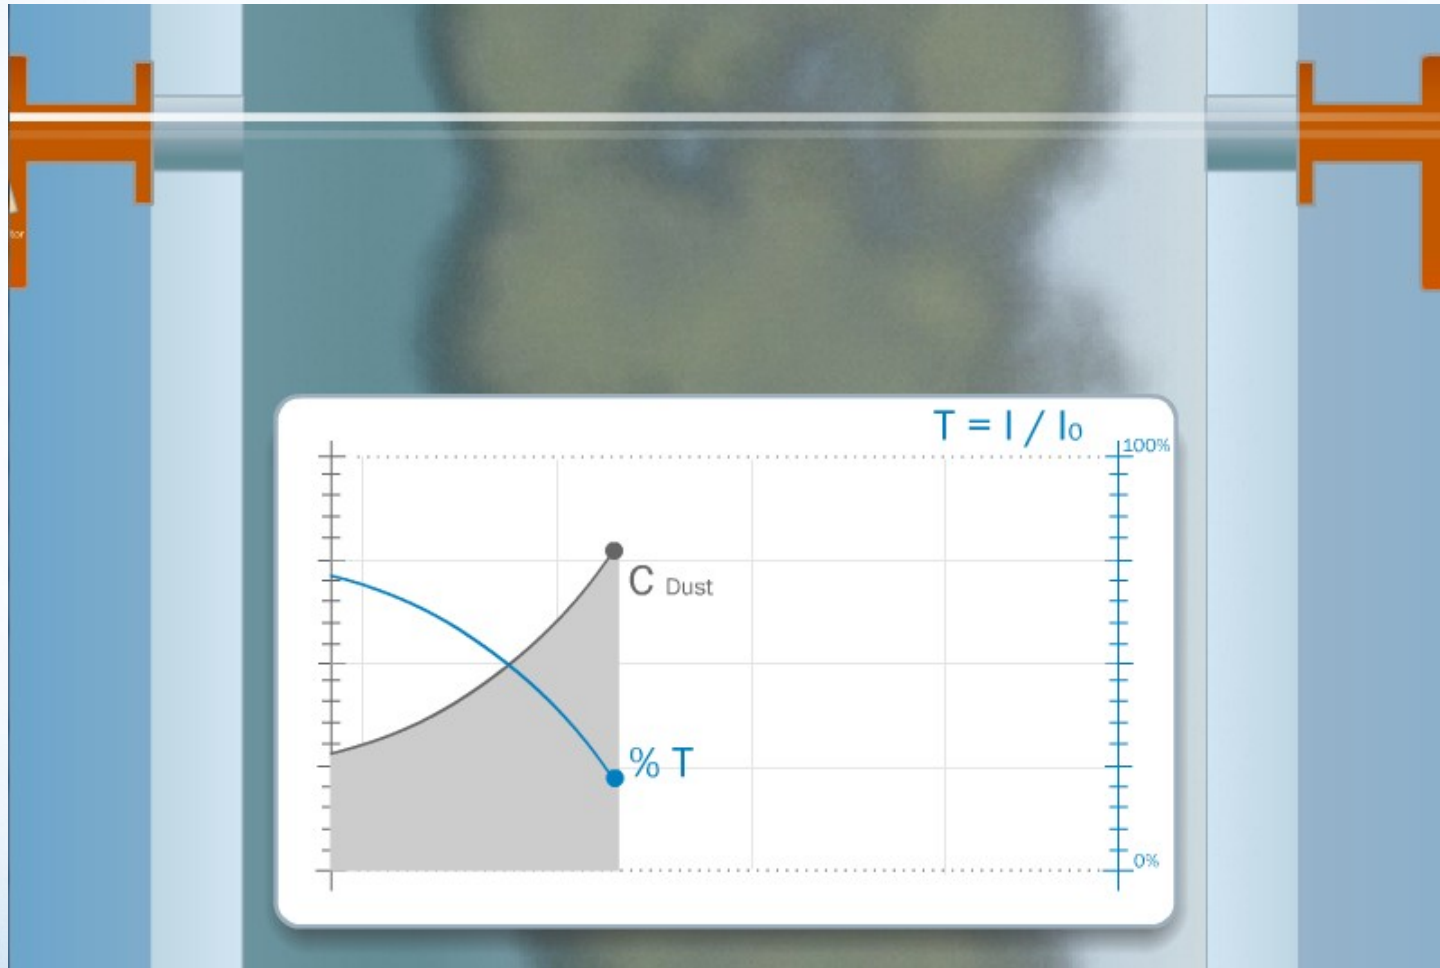

### > Transmission principle

### > Transmission principle

## › Scattered light (forward)

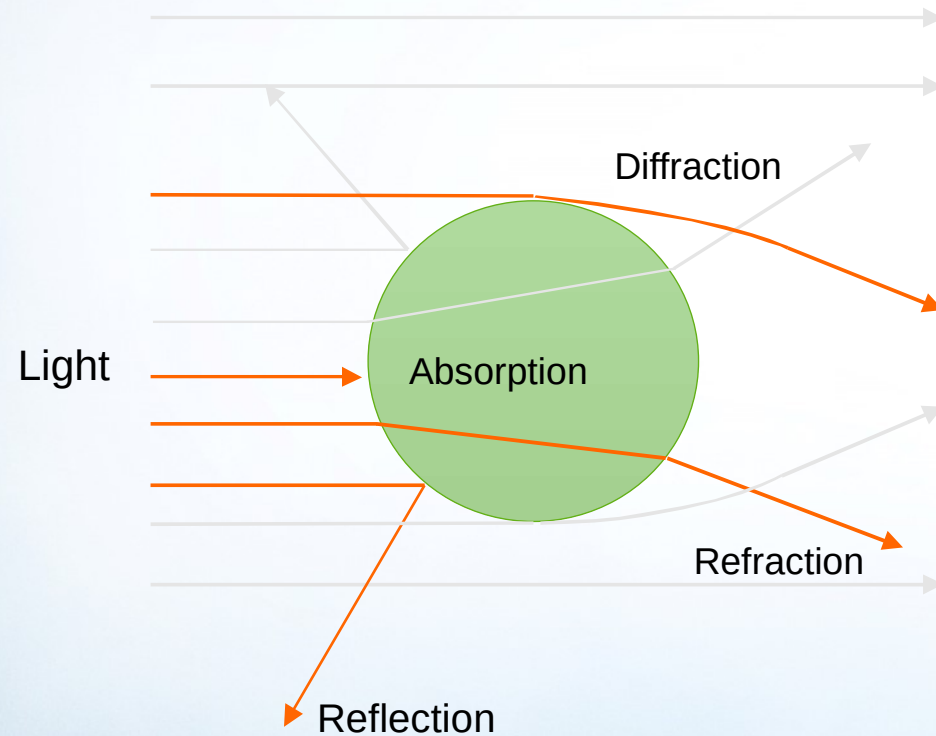

- Radiation of the dust loaded measuring volume with visible laser light (wavelength approx. 655 nm);
- Receiver is on the transmitter side (for low to medium dust concentrations)

# Solutions & Field Installations

CEMS – Dust

## › Scattered light (forward)

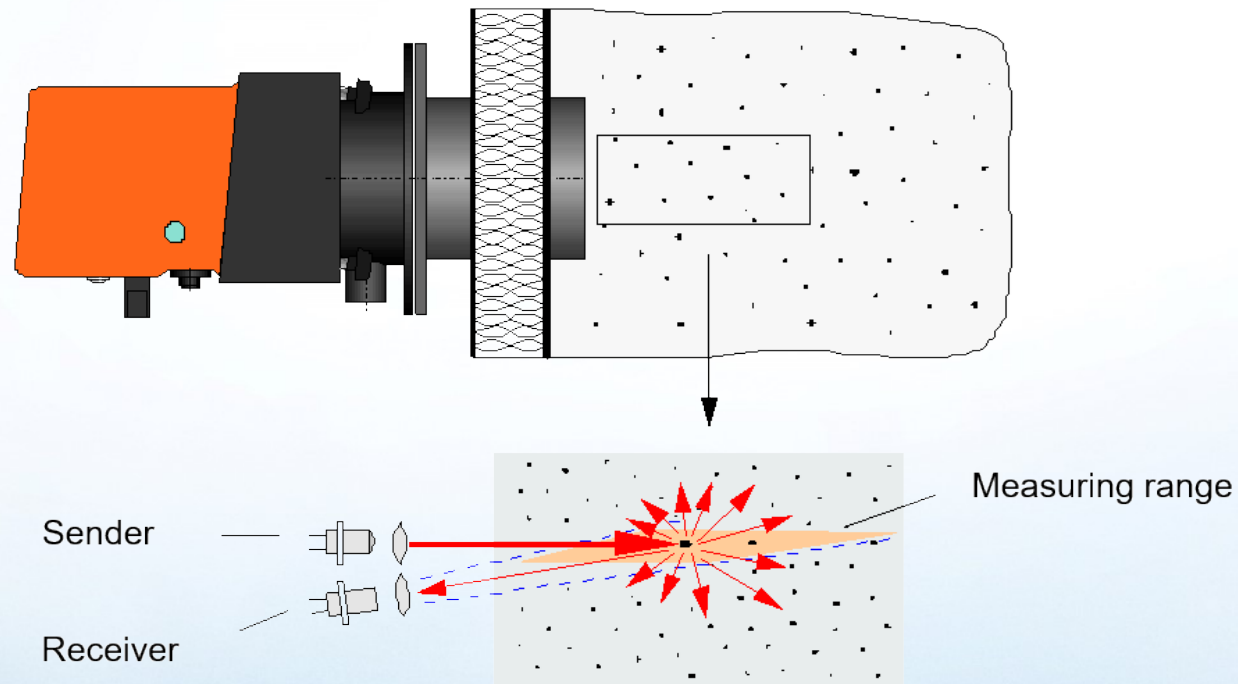

Everyday situations

## › Scattered light (backward)

- Radiation of the dust loaded measuring volume with visible laser light (wavelength approx. 655 nm);
- Sender/Receiver unit (for low to medium dust concentrations)

# Solutions & Field Installations

## CEMS – Dust

### › Scattered light (backward)

- Dusthunter SB30
- Process control of by-pass filter
- Continuous dust measurement
- Independent of flow velocity
- Rapid detection of filter breaks

# Solutions & Field Installations

## CEMS – Dust

### › Scattered light (wet dust)

- Measuring dust emissions downstream of flue-gas desulfurization plants and wet purifiers
- Monitoring dust concentrations in the wet exhaust gas of industrial processes
- Gas is extracted via a gas sampling probe and heated above the dew point.
- Droplets in the gas are vaporized, making it impossible for them to falsify the measurement results
- Very low maintenance since no moving parts come into contact with the aggressive gas
- For very low to medium dust concentrations
- Gas sampling and return combined in one probe

# Solutions & Field Installations

## CEMS – Dust

### > Scattered light (wet dust)

- SICK FWE200DH + Seawater FGD
- Fully comply with regulations (CEMS)
- Customized probe geometry
- “We haven't had a single problem since we installed it” **NORCEM**  
HEIDELBERG CEMENT Group

# Solutions & Field Installations

CEMS – Dust

## DUSTHUNTER SP

Scattered light forward  
(probe)

## DUSTHUNTER SB

Scattered light backward

## DUSTHUNTER SF

Scattered light forward  
(cross-stack)

## DUSTHUNTER T

Transmission

## DUSTHUNTER C

Transmission +  
scattered light forward

## FWE200 DH

Scattered light forward (extractive)

# Solutions & Field Installations

## CEMS – Gas Flow

### › FLOWSIC100 – Gas Flow Meter

- **Ultrasonic** transit time difference measurement (transducer technology)
- Medium & high power versions available
- "H" suitable for stacks with **large diameters**
- "M" suited for stacks with **medium diameter**
- Internal cooling and air purging available
- Durable **titanium converters** for long service life
- Automatic **operational check** with zero and reference point test
- Accurate measuring results under difficult measuring conditions
- Measurement **without pressure loss**, therefore no influences on the process

# Solutions & Field Installations

## CEMS – Temperature & Pressure

### › Pressure measurement

- Resistance thermometer PT100
- Temperature range: 0-600 °C
- Transmitter with isolated output: 0/4 - 20mA or 0 - 10 V
- LCD display
- Blank flange (ST37) for easy installation

### › Temperature measurement

- Absolut pressure transducer
- measuring range: 800 - 1200 mbar abs.
- output signal: 4-20 mA
- Stainless steel
- Blank flange & adapter for easy installation

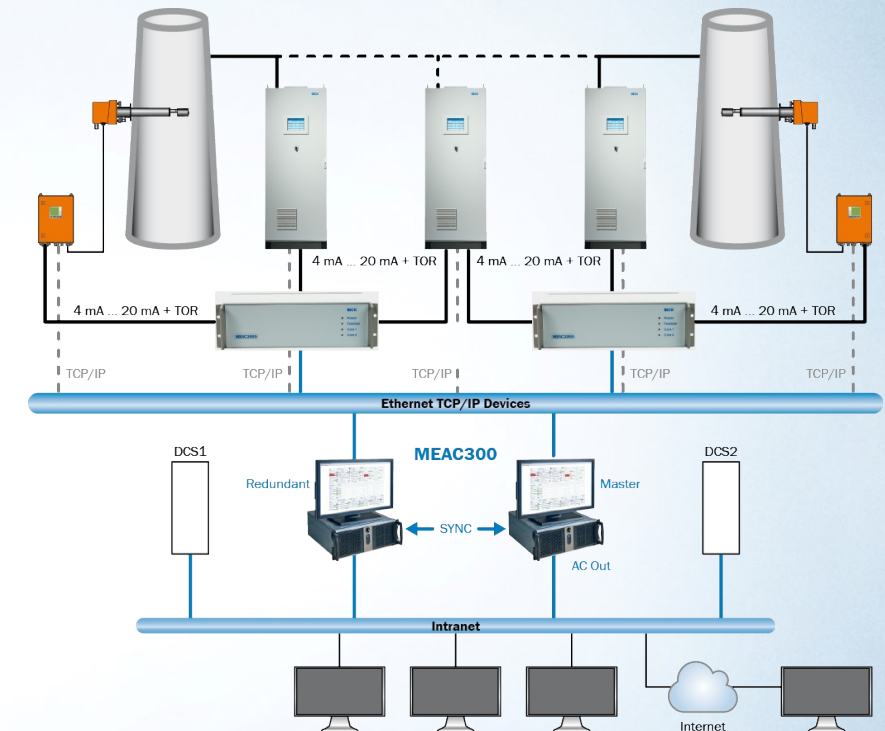

# Solutions & Field Installations

## CEMS – Data Acquisition

### › MEAC300

- **Emission PC**
- Acquisition, evaluation, storage, visualization & transfer of emission data for modern **emission data management**
- Analog and digital **data collection** saved at 5 s/1 min intervals with **auto-backup**
- Distributed **visualization**, operation in the network and automatic e-mail alarms
- Flexible **data presentation** also in process images
- Time savings through **simulation mode** for installation and functions checks
- Parallel calculation of **greenhouse gas emissions** in the same system
- **Reporting tool**

**SICK**  
Sensor Intelligence.

## CEMS – Shelters & Systems

### > Shelters & Systems

- Heating/Cooling/Ventilation (redundant on req.)
- Standard shelter, 10 to 40 feet
- Insulation and high-quality paint (C5)
- Fire alarm and fire extinguishers available
- CSC certificate for standard dimensions
- Suitable for ATEX zones
- Earthquake-safe and fireproof types available (F30, F60)
- Special constructions

### > Process Gas Analysis

#### – Measurement at:

- Kiln Inlet / Kiln Back End **1** (e.g. CO, O<sub>2</sub>, NO, NO<sub>2</sub>, SO<sub>2</sub>, HCl, CH<sub>4</sub>, H<sub>2</sub>O)
- Calciner outlet **2** (e.g. CO, O<sub>2</sub>, NO, NO<sub>2</sub>, SO<sub>2</sub>, NH<sub>3</sub>, HCl, CH<sub>4</sub>, H<sub>2</sub>O)
- Preheater outlet **3** (e.g. CO, O<sub>2</sub>, NO, NO<sub>2</sub>, SO<sub>2</sub>, CH<sub>4</sub>)

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## > SCP3000 – Gas extraction probe

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## › SCP3000 – Gas extraction probe

### – System design

- Highly corrosive-resistant probe material (1.4841)
- 2500/3000/3500/4000mm probe length available
- 2 µm metal mesh filter (heated with regulation)
- Heated shut-off valves for sample line and back flushing
- No thermal bridges and no mechanical movements
- Retraction and Rotation unit to prevent backing of deposits

→ Prevent corrosion,  
condensation &  
blocking

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## › SCP3000 – Gas extraction probe

### – Optimized probe geometry

- sampling intake open to the bottom → Limited dust entrance
- Flow optimized & reinforced sampling intake → Limited attack surface against abrasion & caking
- Large collection volume → Not effected by thermal stress & blockages
- Coolant flow to the tip along probe's external & back flow along probe's internal diameter → Prevent condensation effects

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## › SCP3000 – Gas extraction probe

### – Effective probe cleaning cycle

- Probe back purge (high pressure shock blow)
- Filter blow back
- Filter chamber blow back
- Filter, filter chamber & probe blow back

→ Prevention of blockages / high availability

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## › SCP3000 – Gas extraction probe

### – Rotation module

- Double probe movement: backward/forward 10cm and rotation  $45^\circ$  (and reverse)
- Pneumatic piston drive
- Heavy duty piston, bearings & valves

- Prevent caking of dust on the probe & flange
- High availability
- Full day operation / probe does not leave kiln

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## › SCP3000 – Gas extraction probe

### – Sealing box

- Designed to protect external area from raw material flow out from the kiln
- Mechanical solution for a higher reliability in harsh conditions
- Possibility to connect instrument air for protection tube cleaning
- Directly fixed on the flange for an easy installation

→ high availability

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## › SCP3000 – Water/water cooler

- The principle is a plate and frame heat exchanger
- Water flow consumption: 3m<sup>3</sup>/h with max. 30°C
- Cooling capacity: 70 kW with cooling delta of 40°C
- Temperature + Pressure + Flow are always under control for primary and secondary circuit.
- Mixture valve manage the liquid regulation autonomous
- Dimensions L x W x H: 1200 x 1600 x 600 mm

## Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

### › **SCP3000 – Air/water cooler**

- The principle is a plate and frame heat exchanger
- Heat exchanger surface 174 m<sup>2</sup>
- Cooling capacity: 72 kW at 40°C ambient temperature and 60°C coolant temperature
- Air flow 16,7 m<sup>3</sup>/h, 0,86 kW, 420 rpm, 75 db.
- Dimensions (L x W x H) 2300 x 1170 x 1480 mm

## Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

### › **SCP3000 – Air/water cooler**

- The principle is a plate and frame heat exchanger
- Heat exchanger surface 174 m<sup>2</sup>
- Cooling capacity: 72 kW at 40°C ambient temperature and 60°C coolant temperature
- Air flow 16,7 m<sup>3</sup>/h, 0,86 kW, 420 rpm, 75 db.
- Dimensions (L x W x H) 2300 x 1170 x 1480 mm

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## › SCP3000 – PLC

- Control Unit
  - Touch screen panel in standard :
  - easy interface with the system
  - easy to use
- Standard Plc
  - Siemens S7-300
  - ALLEN – BRADLEY MicroLogix 1400

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## › SCP3000 – PLC

- Local operating panel
  - Control of the probe (forward, backward)
  - Manual starting of a back flushing cycle
  - Emergency control of the probe to prevent from damages
- Signal lamps:
  - **Red** flashlight signal → Failure
  - **Orange** light → System ready
  - **Orange** light blinking → Probe in movement
  - **White** light → Normal operation in automatic mode

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## › SCP3000 – What we have learned from “dirty” fuels / our development process

- E.g. use of petcoke & alternative fuels

# Solutions & Field Installations

## Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

### › SICK Gas Analyzers – Best choice for alternative fuel combustion

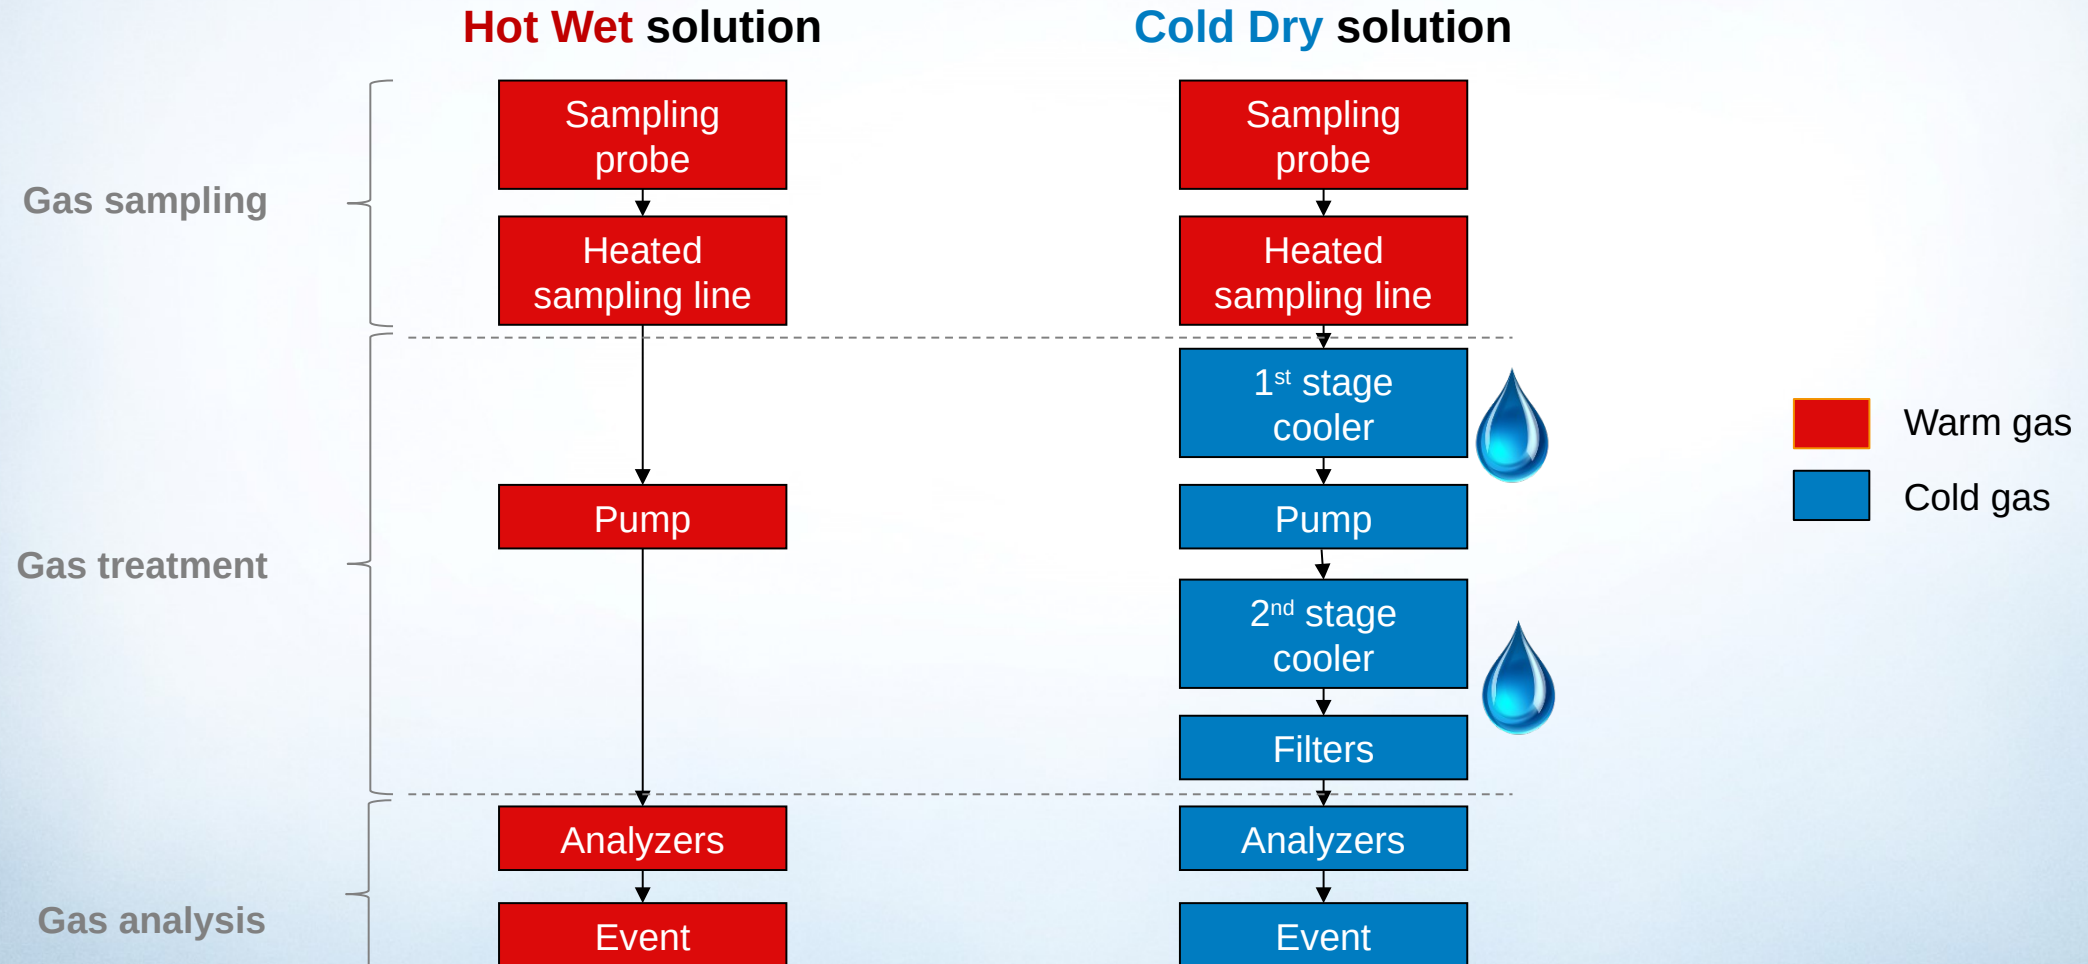

- Both technologies are offered by Sick
- Technology depending on main fuel & gas components
- For alternative fuel usage SICK recommends the **Extractive Hot Wet** technology

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## > SICK Gas Analyzers – Best choice for alternative fuel combustion

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## › SICK Gas Analyzers – Best choice for alternative fuel combustion

- Why the **Cold Dry** - system is not recommended with e.g. (high) SO<sub>2</sub> concentrations?
  - At high SO<sub>2</sub>-concentrations, (esp.in cement flue gases):
    - Creation of sulphuric acid aerosols and droplets
    - Causing corrosion in measuring cells of the analyzers
  - Removal of aggressive acids needed to protect analyzer (e.g. hydrogen peroxide, H<sub>2</sub>O<sub>2</sub>)
  - Higher costs for maintenance and spares to achieve the same reliability as a **Hot Wet** -system.

## Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

### › MCS300P hot wet process gas analyzer

– OPEX comparison (kiln inlet analyzers) / kEur/a

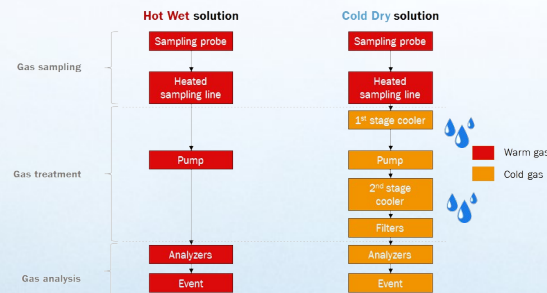

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## › Hot Wet measurement technology

- Completely heated measuring path (200°C)
  - Sampling, treatment, analysis (above dew point)
  - No gas cooler required
  - No problems associated with condensates
  - “Real”, fast and accurate measurement of water-soluble components e.g.  $\text{NH}_3$ ,  $\text{HCl}$ ,  $\text{SO}_2$
  - Less maintenance & consumables/span gases

SICK SCP3000

SICK MCS300P

# Solutions & Field Installations

Combustion Control (pyro process) – Kiln Inlet

## > **ÇİMSA** Cimento, Turkey

- Cyclone blockage study using SCP3000/MCS300P kiln inlet monitoring system

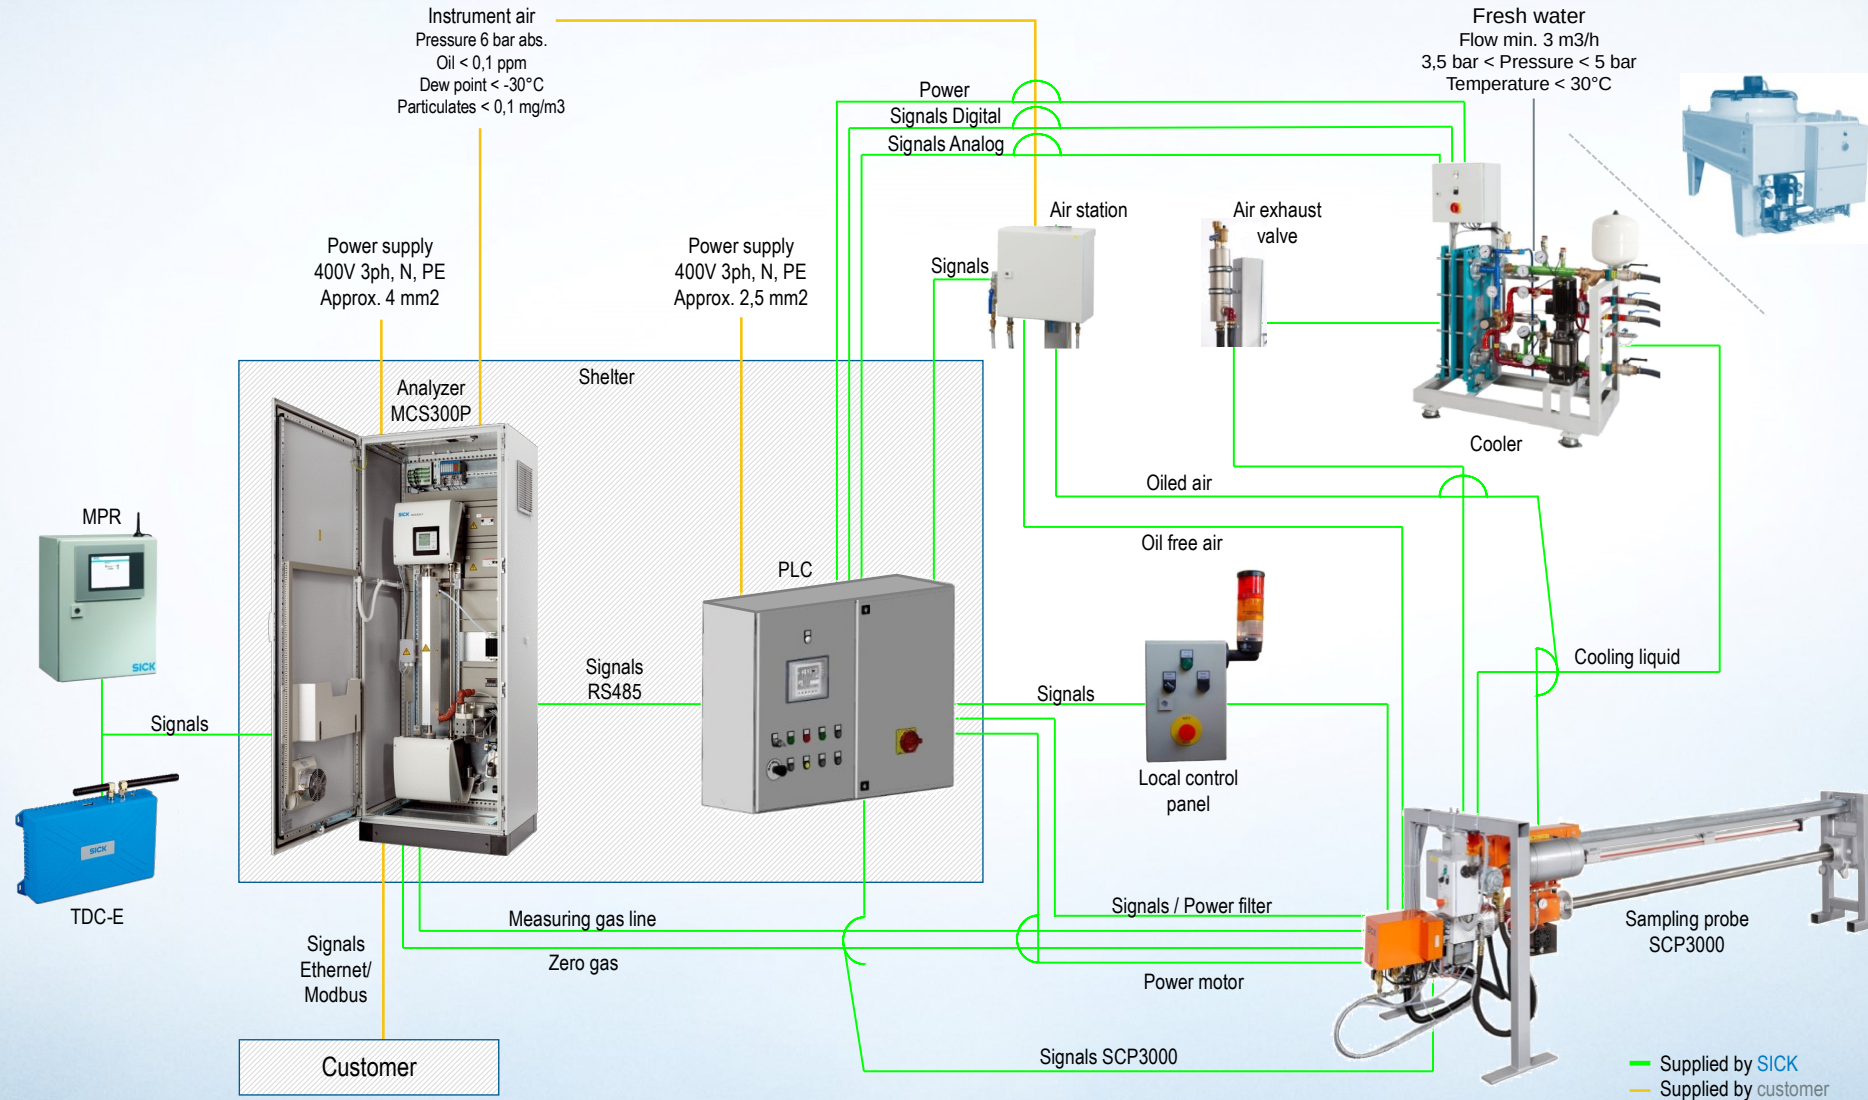

- if SO<sub>2</sub> amount increases above 15.000 ppm in the kiln inlet, cyclone **blockage** possibility can reach up to **80%**!

## Global Cement Magazine May 2020

**GLOBAL CEMENT: EMISSIONS**

Alexandra Kirchhoff, Tobias Egle & Felix Bartknecht, SICK AG

### Controlling NO<sub>x</sub> effectively

The general trend towards environmental awareness in the cement sector has prompted plants to reduce or eliminate emissions of hazardous substances. Here, SICK AG reports on a NO<sub>x</sub> emissions abatement project at HeidelbergCement's Geseke plant in Germany.

Supporting effective climate protection and preserving and restoring a clean environment are major goals for modern cement producers, whether it is due to new environmental legislations, pressure from local populations, external organisations and company stakeholders or due to self-imposed sustainability commitments. Nitrogen oxides (NO<sub>x</sub>) and other nitrogen compounds that arise from cement production are a major cause of photochemical smog and the formation of nitric acid and acid rain. They are formed either by a combustion of fuel-based nitrogen with oxygen within the flame or by a combination of atmospheric nitrogen with the combustion air.

The two main mechanisms for the production of NO<sub>x</sub> in a clinker manufacturing process are the reaction of nitrogen (N<sub>2</sub>) in combustion air at high temperatures (thermal NO<sub>x</sub>) and the combustion of nitrogen-containing fuels (fuel NO<sub>x</sub>). Globally the emission limits for NO<sub>x</sub> are heading down rapidly, with increasingly strict penalties for non-compliance. However, there are still large differences. Most national limits are in the region 500-1000mg/Nm<sup>3</sup>. Some plants in the EU have taken pioneering roles by having fixed emission limit values as low as 200mg/Nm<sup>3</sup>, depending on which kiln process is applied and the type of fuel.

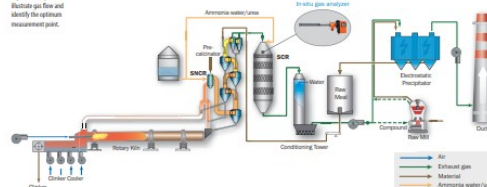

SCR and SNCR technologies

SCR and SNCR denitrification (DeNO<sub>x</sub>) plants use ammonia (NH<sub>3</sub>) or urea (CH<sub>4</sub>N<sub>2</sub>O) to reduce NO<sub>x</sub> to form harmless nitrogen (N<sub>2</sub>) and water (H<sub>2</sub>O). The main difference between the two technologies is whether or not a catalyst is used. The SNCR, i.e. DeNO<sub>x</sub> without a catalyst, is installed in the riser duct or calciner after the rotary kiln at a temperature range of 900-1000°C. Depending on the type of the SNCR it can be placed in the high-dust raw gas stream (e.g. directly after the pre-heater) or before the main stack in the low-dust gas stream as a so-called 'tail-end' or 'low-dust' SNCR.

SCR and SNCR denitrification (DeNO<sub>x</sub>) plants use ammonia (NH<sub>3</sub>) or urea (CH<sub>4</sub>N<sub>2</sub>O) to reduce NO<sub>x</sub> to form harmless nitrogen (N<sub>2</sub>) and water (H<sub>2</sub>O). The main difference between the two technologies is whether or not a catalyst is used. The SNCR, i.e. DeNO<sub>x</sub> without a catalyst, is installed in the riser duct or calciner after the rotary kiln at a temperature range of 900-1000°C. Depending on the type of the SNCR it can be placed in the high-dust raw gas stream (e.g. directly after the pre-heater) or before the main stack in the low-dust gas stream as a so-called 'tail-end' or 'low-dust' SNCR.

The advantage of measuring at the inlet is the simultaneous measurement of the NH<sub>3</sub> and NO levels that enter the SCR. Here, NH<sub>3</sub> is the sum of ammonia

Figure 1: Diagram to illustrate gas flow and identify the optimum measurement point.

24 Global Cement Magazine May 2020

**GLOBAL CEMENT: EMISSIONS**

The efficiency of the reaction between NH<sub>3</sub> and NO<sub>x</sub> is critically temperature dependent. At temperatures greater than 1200°C, NH<sub>3</sub> converts to NO<sub>x</sub>. At temperatures lower than 800°C, some ammonia remains unreacted (termed ammonia slip). Thus, efficient and well-adjusted ammonia injection is of high importance for the compliance of gas emission limits when using an SNCR. The presence of the catalyst in the SCR allows the operation at lower temperatures and offers a higher stoichiometric ratio. This requires less reducing agent and ensures lower NH<sub>3</sub> slip. This ensures that even low NH<sub>3</sub> and NO<sub>x</sub> emission limits can be adhered to.

Case study at HeidelbergCement Geseke

Due to the rising demand for SCR and SNCR units in cement production, the need for a measurement technology that can be used to control these plants efficiently is also on the rise. There has been a 200mg/Nm<sup>3</sup> emission limit for NO<sub>x</sub> in Germany since 1 January 2019, as well as a 50mg/Nm<sup>3</sup> limit for NH<sub>3</sub>. To comply with local emission regulations, HeidelbergCement decided to invest in an SCR system in addition to a previously installed SNCR solution at its Geseke plant in North Rhine-Westphalia, Germany. Installation of the solution was completed in March 2019.

During planning and implementation of the project, the question of the best type of analyser that could fulfil the requirements for an efficient SCR control was addressed. The device would be placed at the SCR inlet between the ammonia water injection nozzles and the catalyst (Figure 1). Of high importance was a fast analyser response time to enable very efficient control of the ammonia water injection. A long maintenance interval was also critical, especially in the very challenging operating conditions.

The advantage of measuring at the inlet is the simultaneous measurement of the NH<sub>3</sub> and NO levels that enter the SCR. Here, NH<sub>3</sub> is the sum of ammonia

evaporation from the raw materials, the ammonia slip of the SNCR and the ammonia water injection for the SCR. It was also possible to measure the NO concentration from the combustion process. With this measurement and a continuous emission monitoring system (CEMS) at the main stack as backup, feed forward control would be possible.

During the planning phase, HeidelbergCement contacted SICK to provide a solution that best fitted the above requirements. As the only provider of all major gas measuring principles and technologies alongside many years of experience, SICK is able to provide the high-quality measuring technology for each application. In this case, the company recommended its GM32 in-situ analyser in order to cope with the very challenging process conditions: high dust, high temperature and vibrations.

GM32: The innovative in-situ gas analyser

The in-situ GM32 gas analyser simultaneously measures up to four components - NO, NO<sub>2</sub>, NH<sub>3</sub>, SO<sub>2</sub> - as well as the temperature and pressure directly inside the process gas stream. The direct measurement inside the duct (in-situ) leads to fast measuring results due to a short response time, making it well suited to process control. The analyser unit is equipped with a gas permeable probe (GPP), which is positioned inside the duct (Figure 2).

Using wavelength-specific light absorption by the gas mixture on the active measuring path, the sender/receiver unit determines the concentration of the gas

Left: Figure 2: Installation of the GM32 at the SCR inlet at the Geseke plant.

Right: Figure 3: GM32 measurement technology. Optical path (left) and UV absorption spectra (right).

Global Cement Magazine May 2020 25

**GLOBAL CEMENT: EMISSIONS**

Right: Figure 4: GM32 in-situ during a position check-up.

components present. UV light sent from the sender/receiver unit passes the active measuring path of the GPP probe and is reflected by a single reflector at the end of the probe. The permeable filter element - the heart of the GPP - keeps all dust outside of the measurement path, where the light passes through. The gas quickly permeates through the pores, ensuring a real-time measurement, hence a rapid response time is ensured.

The GM32 uses the differential optical absorption spectroscopy (DOAS) principle where the absorption lines of specific gases in a particular wavelength range are evaluated. Neither the filter nor the rest of the gas analyser require weekly or monthly checks, cleaning or other high frequency maintenance work.

Due to the higher temperature and possible temperature fluctuations at the measuring location, stack movements are possible. With the implemented auto alignment correction, which aligns the light beam continuously during operation, stack movements as well as vibrations can be compensated for. This ensures a stable and reliable measurement.

In comparison with many other measuring systems, many of which require frequent test gas calibration, the GM32's integrated filters for zero and span check (approved according to EN15267) automatically compensate for drift and ensure correct and accurate measurements. This helps to keep operational expenditures very low.

Proven technology

The final commissioning of the in-situ gas analyser at the HeidelbergCement Geseke plant took place in March 2019 (Figure 4). During a 12-month testing period up until March 2020, SICK and the cement plant proved that, for this application, the GM32

only needs to be checked once every 9-12 months. With the help of the SICK Monitoring Point Router remote service, on-site tests were performed and a large amount of additional process data, including the CEMS concentration values at the main stack, was collected and evaluated in various ways. During the test period it was proven that the analyser has a stable reaction time of <20s (Figure 5), without the need for any cleaning or maintenance work.

The process data showed that, with a delay of up to 2-17 minutes (depending on the measuring component), a CEMS alone is not sufficient for DeNO<sub>x</sub> process control. This is especially the case for NH<sub>3</sub> values, for which the CEMS exhibits a huge delay in comparison to the in-situ process gas measurement (Figure 5). This is due to the high adsorption of ammonia on surfaces such as the filter and heated measurement lines. Controlling the SCR with such delayed measuring values will lead to an excessive injection of ammonia water and rapid breach of the NO and NH<sub>3</sub> emission limit values at the main stack. Therefore, SICK's GM32 in-situ measurement device has proven to be the right device for this kind of application.

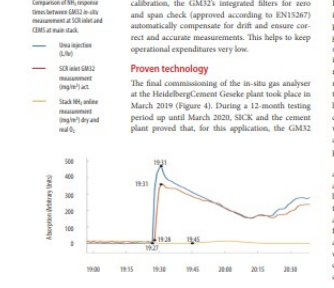

"We are very satisfied with the performance of the GM32 gas analyser," stated Dr.-Ing. Steffen Gajewski, Geseke Plant Manager, and Dipl.-Ing. Stefan Nuber, the plant's Operations Manager. "The GM32 project was executed in full compliance with the requirements and schedule. We are looking forward to continued good cooperation."

Remote service and condition monitoring

In the future SICK and HeidelbergCement plan to implement SICK's Monitoring Box in order to offer predictive maintenance services for all of the plant's gas analysers and dust measurement equipment. This solution allows SICK to optimise maintenance, monitor critical components or device conditions and to monitor product health and recommend maintenance actions remotely. This will enable immediate troubleshooting, which reduces repair expenses and labour hours for service engineers. Furthermore, continuous remote condition monitoring combined with remote assistance and agreed response times assure compliance with local emission regulations, process stability and continuous production.

Due to the performance of the GM32 in-situ gas analyser and the excellent cooperation between SICK and the operators at the Geseke plant, another HeidelbergCement plant in Germany has now also decided to equip its existing DeNO<sub>x</sub> system with two GM32 analysers for SCR control. The project is scheduled for completion in April 2020. This together with an open and intense information exchange during various environmental and process seminars have contributed to a strong partnership between SICK and HeidelbergCement.

Figure 5: Comparison of NH<sub>3</sub> response times between GM32 in-situ measurement of 50-1000 and CEMS at main stack.

# Solutions & Field Installations

## Conveyor Operation – Bulkscan LMS511

### > Non-contact volume flow measurement

V: Volume of a bulk good slice at the time x

V(n+x)

| Measured values   |                       |
|-------------------|-----------------------|
| Volume flow rate  | 1525.69 t/h           |
| Mass flow rate    | 596.32 m <sup>3</sup> |
| Volume sum        | 298.16 t              |
| Mass sum          | 0.49                  |
| Center of gravity | 0.52                  |
| Bulk density      | 0.50 t/m <sup>3</sup> |
| Belt speed        | 1.00 m/s              |
| Reset             |                       |

Belt velocity

## Solutions & Field Installations

### Conveyor Operation – Bulkscan LMS511

#### › Non-contact volume flow measurement

- Light source: Infrared (905 nm)
- Max. scan frequency: 35 Hz, 50 Hz, 75 Hz
- Scanangle: 190°
- Angle resolution: 0,5°
- Response time: 13 ms, 20 ms, 30 ms
- Laser class: 1, IEC 60825-1 (2007-6), eye-safe
- Heating system yes
- Ambient temperature: -30 ... +50°C
- Degree of protection: IP67

**Bulkscan LMS511**

# Solutions & Field Installations

## Conveyor Operation – Bulkscan LMS511

### › Non-contact volume flow measurement – Bulkscan LMS511

- High operating range (0.5...20m)
- Wide aperture angle (190°)

# Solutions & Field Installations

Conveyor Operation – Bulkscan LMS511

## › Non-contact volume flow measurement – Bulkscan LMS511

- 5 echo-pulse technology

# Solutions & Field Installations

## Conveyor Operation – Bulkscan LMS511

### › Non-contact volume flow measurement – Bulkscan LMS511

Bulk height

Center of gravity

Bulk edge & Conveyor edge

- ▶ Increased belt life (loading alert)
- ▶ Minimum maintenance
- ▶ Non contact measurement
- ▶ Unaffected by environment
- ▶ High resolution

### › Non-contact volume flow measurement – Bulkscan LMS511

#### – Contamination Measurement

- Information / Warning output
- Diagnostics on the device

| Contamination measurement |                                        |
|---------------------------|----------------------------------------|
| Strategy                  | <input type="text" value="Sensitive"/> |
| Response time             | <input type="text" value="1"/> sec     |
| Threshold warning         | <input type="text" value="70"/> %      |
| Threshold error           | <input type="text" value="30"/> %      |

#### – Bulk Height Measurement

- Information / Warning output
- Diagnostics on the device

Perpendicular point strategy

Measurement  
(by Bulkscan LMS511)

# Solutions & Field Installations

## Conveyor Operation – Conveyor Hot Spot Detection (CHD) System

### › Early fire detection / prevention of silo fires – CHD System

- The Conveyor Hotspot Detection System deploys thermal imaging cameras to detect fire hazards at an early stage.
- The system continuously and fully automatically measures the temperature of the transported material.
- As soon as a hotspot above the defined limit is detected an alarm is sent out.

#### Thermal Camera

Thermal imaging camera for measuring and visualizing the temperature of the material passing by.

#### TDC-E

The TDC-E as Controller for process, visualize and pass on the measurement data.

## Solutions & Field Installations

### Conveyor Operation – Conveyor Hot Spot Detection (CHD) System

#### > Conveyor hotspot detection combined with SICK Bulkscan®

- Non-contact time-of-flight technology to measure the volume flow of bulk materials on conveyor belts.
- Reliable volume flow signal irrespective of weather conditions thanks to multi-echo technology.
- Additional features:
  - Level measuring
  - Center of gravity
  - Belt monitoring

# Solutions & Field Installations

## Stock Pile & Silo Level Monitoring

### > Stock pile measurement

- e.g. for raw material & bulky/alternative fuels
- Contour, volume, distance measurement using **2D LiDAR** sensors
- Preventing dust formation & collisions
- Optimized material handling & machine positioning

# Solutions & Field Installations

## Stockpile & Silo Level Monitoring

### > Stockpile measurement

#### – Crane automation

LD-LRS

### › **Stacker control / distance measurement using Dx1000**

# Solutions & Field Installations

## Stockpile & Silo Level Monitoring

### › Silo Level Measurement – SicWave LBR

- Free Space radar sensor
  - 80 GHz free space non-contact radar level sensor for bulk solids
  - Flexible measuring range up to 120 m
  - Process temperature range -40°C ... +200°C
  - Process pressure -1 ... 20 bar
  - Plastic or aluminum housing
  - Enclosure rating IP66/IP67 and IP66/IP68
  - Ex-approvals
  - 4...20 mA (2-wire) with HART communication
  - Bluetooth incl. level-app

# Solutions & Field Installations

## Driver Assistance

### > Collision Awareness Systems

- Infrastructure, area & distance monitoring
- Guiding systems for production optimization
- Operator warning to prevent collisions & downtime

# Solutions & Field Installations

## Driver Assistance

### › Collision awareness systems - MINESIC100 TPS/EPS/WPS

- Front/End Collision Warning
- Reverse Assist
- Road Departure Warning
- Black Spot Warning
- Underground Tunnel Collision Warning
